

1-Bit Dual-Supply Unidirectional Bus Transceiver

1 FEATURES

- **Power-Supply Range:**
 V_{CCA} and V_{CCB} : 1.65V to 5.5V
- **V_{CC} Isolation:** If Either V_{CC} is at GND, Both Ports are in the High-Impedance State
- **Low power consumption, 4 μ A Max**
- **Output drive up to ± 24 mA @3.0V**
- **No Power-Supply Sequencing Required:** Either V_{CCA} or V_{CCB} can be Ramped First
- **I_{OFF} :** Supports Partial-Power-Down Mode Operation
- **Extended Temperature:** -40°C to +125°C

2 APPLICATIONS

- Industrial
- Enterprise
- Telecom, such as VOIP
- Personal electronic

3 DESCRIPTIONS

The RS1T34 is 1-bit non-inverting bus transceiver uses two separate configurable power supply rails. The A port is designed to track V_{CCA} , which supporting operating voltages from 1.65V to 5.5V, and the B port supporting operating voltages from 1.65V to 5.5V while it tracks the V_{CCB} supply. This allows for universal low-voltage unidirectional translation between any of the 1.8V, 2.5V, 3.3V and 5V voltage nodes.

The RS1T34 is designed for asynchronous communication between two data buses. The A bus is input side, the B bus is output side.

The RS1T34 is fully specified for partial power-down applications using I_{off} . The I_{off} circuitry disables the outputs, preventing damaging current backflow through the device when it is powered down.

The RS1T34 is available in Green SOT23-5 and SOT353(SC70-5) packages. It operates over an ambient temperature range of -40°C to +125°C.

(1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

(2) The input and output negative-voltage ratings may be exceeded if the input and output current ratings are observed.

(3) The value of V_{CCA} and V_{CCB} are provided in the recommended operating conditions table.

(4) The package thermal impedance is calculated in accordance with JESD-51.

(5) The maximum power dissipation is a function of T_{J(MAX)}, R_{θJA}, and T_A. The maximum allowable power dissipation at any ambient temperature is P_D = (T_{J(MAX)} - T_A) / R_{θJA}. All numbers apply for packages soldered directly onto a PCB.

8.2 ESD Ratings

The following ESD information is provided for handling of ESD-sensitive devices in an ESD protected area only.

			VALUE	UNIT
V _(ESD)	Electrostatic discharge	Human-body model (HBM), per ANSI/ESDA/JEDEC JS-001 ⁽¹⁾	±2000	V
		Charged-device model (CDM), per ANSI/ESDA/JEDEC JS-002 ⁽²⁾	±1500	V
		Machine Model (MM)	±200	V

(1) JEDEC document JEP155 states that 500 V HBM allows safe manufacturing with a standard ESD control process.

(2) JEDEC document JEP157 states that 250 V CDM allows safe manufacturing with a standard ESD control process.

ESD SENSITIVITY CAUTION

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

8.3 Recommended Operating Conditions

V_{CCA} is the supply voltage associated with the input port. V_{CCB} is the supply voltage associated with the output port.

(1) V_{CCA} is the V_{CC} associated with the data input port.

(2) V_{CCB} is the V_{CC} associated with the output port.

(3) All unused or driven (floating) data inputs (I/Os) of the device must be held at logic HIGH or LOW (preferably V_{CC1} or GND) to ensure proper device operation and minimize power.

(4) For V_{CCA} values not specified in the data sheet, $V_{IH \text{ min}} = V_{CCA} \times 0.7 \text{ V}$, $V_{IL \text{ max}} = V_{CCA} \times 0.3 \text{ V}$.

(1) V_{CCA} is the V_{CC} associated with the input port.

(2) V_{CCB} is the V_{CC} associated with the output port.

(3) Limits are 100% production tested at 25°C. Limits over the operating temperature range are ensured through correlations using statistical quality control (SQC) method.

(4) Typical values represent the most likely parametric norm as determined at the time of characterization. Actual typical values may vary over time and will also depend on the application and configuration.

(5) Hold all unused data inputs of the device at V_{CCI} or GND to assure proper device operation.
